SECTION 2 TEST PROCEDURE

The test unit was placed in a sealed test chamber measuring 1000ft³ and a microbial suspension was aspirated into the chamber. Air samples were taken from the test chamber once the unit was turned on, and then at client specified intervals over a period of 10 minutes and then plated. The process was then repeated without the test unit in the chamber to provide the natural decay results. All plates were incubated overnight and viral growth on test plate was compared to that of the natural decay control.

Air sampling took place using an SKC BioStage Single-stage impactor for 30 seconds at 12L/min. Results below represent the percent reduction at 10 minutes.
